Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### SUMMARIES

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 XX  
 CC The sequences given in AAR76185-200 and AAR79073-94 are high affinity  
 CC integrin binding peptides which bind to various integrins. Peptides  
 CC which bind to alpha5/beta1 integrins contain the motifs given in  
 CC AAR76185-86 and peptides which bind to alphav/beta5 and alphav/beta3  
 CC integrins contain the motif given in AAR76187. Alphav/beta5 integrins  
 CC are also bound by RGD containing peptides. These peptides assume a  
 CC conformationally stabilised configuration which is due to the  
 CC formation of a disulphide bond, a peptide bond or a lactam bond.  
 CC These peptides may be used for isolating the complementary integrin  
 CC from a sample mixture by contacting them under ionic conditions to  
 CC allow binding of the integrin to the peptide and then separating the  
 CC integrin from the peptide. They can be used for attaching cells to  
 CC a substrate, by binding them to the substrate with the cell. The  
 CC peptides promote wound healing when applied locally and inhibit the  
 CC attachment of osteoclasts to bone. They inhibit angiogenesis,  
 CC metastasis of tumours and migration of smooth muscle cells.

 PS  
 CC The present peptide represents a tumour homing peptide, and is produced  
 CC by in vivo panning. The peptide has an alpha-V-containing integrin  
 CC binding motif, Arg-Gly-Asp (RGD). The in vivo panning comprises  
 CC administering a library of diverse peptides to a subject having a  
 CC tumour, collecting a sample of the tumour, identifying a peptide that  
 CC homes to the tumour, collecting a sample of normal tissue corresponding  
 CC to the tumour, and determining that the peptide that homes to the  
 CC tumour is not present in the normal tissue. The tumour homing peptide can  
 CC be linked to a moiety (e.g. doxorubicin), and used to direct the  
 CC moiety to a tumour.

XX Nucleic acid delivery vehicles useful for transfecting and infecting a  
PT target cell -  
XX  
XX Claim 22; Page 39; 118pp; English.  
XX  
XX This sequence represents a RGD-containing peptide that can be used in a  
CC bifunctional complex used in the nucleic acid delivery vehicle (I) of the  
CC invention. (I) is for transfecting and/or infecting a target cell, and

CC comprises a transgene and a bifunctional complex (B) that targets the  
CC nucleic acid delivery vehicle to the cell surface. (B) comprises a  
CC delivery vehicle binding portion, a cell surface molecule binding portion  
CC (such as this sequence) and a linker connecting them. The delivery  
CC vehicle can be specifically targeted to the cell via the binding to cell  
CC surface molecules. (I) can be used to target cells, which express  
CC integrins such as, HT-29 colon carcinoma cells, lymphocytes and  
CC monocytes, blood platelets, SMC-90 human lung fibroblast, MG(63)  
CC osteosarcoma cell line, vascular endothelial cells and melanoma cells.  
CC (I) is useful for delivery of nucleic acids encoding CPTP (cystic  
CC fibrosis transmembrane regulator), alpha1-antitrypsin,  
CC beta-glucocerebrosidase and suicide genes. The construct increases the  
CC efficiency of cellular uptake of (I). The constructs also enable the  
CC transfection/infection of cells that are normally refractory to  
CC transfection/infection by targeting cell receptors that are present on  
CC such cells.

XX Recombinant adenovirus vectors with modified fiber knob loops, useful  
 PT in gene therapy -  
 PT  
 XX

PS Example 21; Page 49; 126pp; English.

CC This sequence represents a synthetic RGD-4C peptide. DNA encoding  
 CC this sequence was cloned into the sequence encoding the HI loop of the  
 CC adenovirus fibre protein knob domain. This was then used in the  
 CC construction of plasmids encoding a modified fibre protein. Recombinant  
 CC adenovirus genomes were generated by homologous DNA recombination in E.  
 CC coli, before excision of the newly generated genome for virus rescue.  
 CC The knob domain of the adenovirus fibre protein mediates the initial  
 CC binding and recognition of the coxsackievirus and adenovirus receptor  
 CC (CAR) on the cell surface. The HI loop protrudes from the knob domain  
 CC and connects beta-strands involved in the formation of the cell binding  
 CC site. Recombinant adenovirus vectors are used in a number of gene  
 CC therapy applications; however, the reliance on the CAR means that  
 CC in certain situations, recombinant virions are sequestered by high  
 CC CAR-expressing non-target cells while the true target cells, if low  
 CC in CAR, receive little of the therapeutic gene. Modification of the HI  
 CC loop by replacement of the hypervariable region of the loop with a  
 CC peptide such as the RGD peptide results in the  
 CC ability of the virus to utilise an alternative receptor during the cell  
 CC entry process. Modifying the adenovirus fibre knob protein in this way  
 CC increases the ability of an adenovirus to transduce a tumour cell in  
 CC vitro, in vivo and ex vivo. The vector Ad5FHIPLAG incorporating an RGD  
 CC peptide demonstrated two to three orders of magnitude  
 CC of increased gene transfer to ovarian cancer cells. The modified  
 CC adenovirus has an altered tropism, which allows the adenovirus to be  
 CC targeted to selected cell types. The recombinant adenovirus can be used

CC to provide gene therapy for individuals suffering from cancer, cystic  
 CC fibrosis and Duchenne's muscular dystrophy.

XX Identifying molecules that home to angiogenic vasculature used as  
 PT targets for anticancer agents  
 PT  
 XX

PS Claim 15; Page 7; 180pp; English.

CC This invention describes novel peptides which home to angiogenic  
 CC vasculature, specifically of a tumour and which have anti-tumour,  
 CC anti-inflammatory, anti-angiogenic and anti-arthritic activity. Such  
 CC molecules are identified by creating a purified NGR receptor with a test  
 CC compound and identifying compounds that bind specifically to the NGR  
 CC receptor. The peptides of the invention are inhibitors of angiogenesis  
 CC and can be used to produce conjugates for delivering agents to  
 CC angiogenic vasculature, particularly anticancer drugs or an imaging  
 CC agent, for diagnosis or prognosis. These conjugates may be directed to  
 CC non-tumour angiogenic vasculature, e.g. that present in inflammatory,  
 CC regenerating or wounded tissue, e.g. for treatment of macular  
 CC degeneration, diabetic retinopathy or rheumatoid arthritis. The peptides  
 CC provide specific targeting to tumours, especially their supporting  
 CC vasculature, since the NGR receptor is exposed to the circulation only in  
 CC angiogenic vasculature. Precise targeting should reduce the systemic  
 CC toxicity of anticancer drugs in the conjugates. Complete killing of all  
 CC target cells may not be essential since partial denudation of endothelium  
 CC may result in an occlusive thrombus, and endothelial cells are unlikely  
 CC to become resistant to anticancer agents nor to lose the targeting  
 CC receptor. AAW93622-W93809 and AAW93843-44 are examples of tumour homing

CC peptides used in the invention.

XX Homing pro-apoptotic conjugate comprising a tumor homing molecule that  
XX selectively homes to a mammalian cell type or tissue linked to an  
XX antimicrobial peptide, useful for the treatment of prostate cancer -

XX Claim 12; Page 105; 118pp: English.

XX The present invention relates to homing pro-apoptotic conjugates,  
XX comprising of a tumour homing molecule that selectively homes to a  
XX mammalian cell type or tissue, linked to an antimicrobial peptide. The  
XX homing pro-apoptotic conjugates are selectively internalised by the  
XX mammalian cell type or tissue and exhibits high toxicity, especially to  
XX angiogenic vasculature. The antimicrobial peptide has low mammalian cell  
XX toxicity when not linked to the tumor homing molecule. The conjugates are  
XX useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and  
XX prostate cancer or melanoma. The present sequence is a homing peptide  
XX isolated in the present invention, which can be conjugated to an  
XX antimicrobial peptide to make the homing pro-apoptotic conjugates of the  
XX present invention.

XX Novel composition of matter comprising an Fc domain and  
XX pharmacologically active peptides, useful for treating cancer and  
XX autoimmune diseases -

XX Claim 39; Page 354; 608pp: English.

XX The present invention describes composition of matter (I) comprising an  
XX Fc domain, pharmacologically active peptides, and linkers. Where (I) is:  
XX (X1)a-F1-(X2)b, where: F1 - an Fc domain; X1 and X2 - are each  
XX independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2,  
XX -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4  
XX where P1, P2, P3, and P4 - are each independently sequences of  
XX pharmacologically active peptides; L1, L2, L3, and L4 - are each  
XX independently linkers; and a, b, c, d, e, and f - are each independently  
XX 0 or 1, provided that at least 1 of a and b is 1. The composition can  
XX have cytostatic, antiasthmatic, thrombolytic and immunosuppressive  
XX activities. DNAs, vectors and host cells from the present invention can  
XX be used for producing pharmaceutical compositions. The compositions are  
XX useful for treating cancer, asthma, thrombosis, or autoimmune diseases.  
XX The use of an Fc domain (rather than a Fab domain) can provide a longer  
XX half-life or incorporate functions such as Fc receptor binding, protein  
XX A binding, complement fixation, and possibly placental transfer. AAB69443  
XX to AAB69526 and AAB16955 to AAB18003 represent nucleotide and amino acid  
XX sequences used in the exemplification of the present invention.

| PS |   |
| XX | This sequence represents a alphav integrin targeting peptide.             |
| CC | The invention relates to an adenovirus from which at                      |
| CC | least a part of the hexon HVR5 or HI loop is replaced with a binding      |
| CC | peptide, or targeting sequence, flanked by connecting amino acid spacers, |
| CC | to functionally display its binding specificity at the capsid surface.    |
| CC | The invention also relates to a recombinant adenovirus vector where a     |
| CC | binding peptide, or targeting sequence, is connected to the C-terminus of |
| CC | the fiber by a connecting spacer, or linker, so as to functionally        |
| CC | display its binding specificity at the capsid surface. The adenovirus or  |
| CC | recombinant adenovirus vector can be used to preferentially express a     |
| CC | gene in a target cell, especially a cell that expresses a UPAR. The       |
| CC | targeted adenovirus vector preferably comprises a heterologous gene       |
| CC | encoding a gene for treatment of a tumour or restenosis. The targeted     |
| CC | adenovirus vector is useful for gene therapy treatment of a disease, and  |
| CC | for manufacturing a medicine used in gene therapy treatment of a disease. |
| CC | The viruses can also be used to inhibit smooth muscle cell proliferation, |
| CC | to treat peripheral artery diseases, coronary artery diseases, obesity,   |
| CC | neurodegenerative diseases, infections, autoimmune diseases, asthma, HIV, |
| CC | thrombosis, and diabetes. The viruses are particularly targeted against a |
| CC | urokinase-type plasminogen activator receptor (UPAR). The adenoviruses    |
| CC | are tropism-modified without adversely impacting productivity of the      |
| CC | vectors.  |

XX Composition for destroying or inhibiting growth of tumour cells and  
 PT for imaging tumours or other biological targets, has molecular  
 PT recognition element attached to fiberless radiative effector having  
 PT a toxic agent -  
 XX  
 XX Disclosure; Page 35; 95pp; English.  
 CC The present sequence is that of a peptide that specifically binds  
 CC to tumour blood vessels. It includes an RGD motif. The peptide,  
 CC and conjugates containing it, selectively binds to various tumours,  
 CC including breast carcinomas, Kaposi's sarcoma and melanoma. The  
 CC peptide can be used as the molecular recognition element of novel  
 CC fiberless radiative effectors (FRS) of the invention. The  
 CC invention is related to cell or pathogen destruction via FRS  
 CC that encapsulate a radical generator. The FRS include a polymer  
 CC matrix, a photodynamic or radiodynamic dye which produces free  
 CC radicals upon stimulation, cloaking material, and at least 1  
 CC molecular recognition element for targeting to a biological target,  
 CC e.g. the present peptide. They are useful in various in vitro and  
 CC in vivo procedures, destroying or inhibiting the growth of  
 CC biological targets (pathogens, macromolecules, tumour cells in  
 CC culture or in the body), in therapies including chemotherapy,  
 CC radiation therapy, antibiotic and vaccine therapy.

 PT Chimeric molecule useful in situ and in vivo imaging of cells and  
 PT tissues e.g. tumor tissues comprises a first domain and a second domain  
 PT  
 PS Claim 9; Page 25; 35pp; English.  
 PS  
 XX  
 CC The present sequence is that of a peptide including the tripeptide  
 CC Arg-Gly-Asp (RGD) motif that is often the primary site of  
 CC recognition by integrins that are expressed on tumour cells and  
 CC which are responsible for tumour invasion and metastasis. Imaging  
 CC of cells that can specifically bind to RGD-expressing peptide and  
 CC polypeptide ligands in vivo can identify tumour cells and tumour  
 CC blood vessels. A claimed chimeric molecule consists of: a first  
 CC domain comprising a fluorescent, bioluminescent or chemiluminescent  
 CC polypeptide or a heterologous kinase; and a second domain comprising  
 CC an RGD motif-containing polypeptide; a selectin-binding polypeptide;  
 CC a matrix metalloproteinase-binding polypeptide, or a chondroitin  
 CC sulfate proteoglycan-binding polypeptide, where the RGD  
 CC motif-containing polypeptide preferably comprises the present  
 CC amino acid sequence. The chimeric molecule is used in methods and  
 CC compositions for imaging cells and tissues in vivo and in situ, and  
 CC especially for identifying sites of primary and metastatic tumours  
 CC and tumour neovasculation. The chimeric molecules enhance the  
 CC imaging of cells and tissues by, e.g., computer assisted tomography  
 CC (CAT), magnetic resonance spectroscopy (MRS), magnetic resonance  
 CC imaging (MRI), positron emission tomography (PET), single-photon  
 CC emission computed tomography (SPECT) or bioluminescence imaging.

XX A method for constructing a fiber-mutant adenovirus vector in which a

XX foreign peptide is introduced by a simple system into the fiber HI

XX loop-coding gene of adenovirus providing a more effective means of

XX introducing foreign peptides -

XX Example 1; Page 4; 13pp; English.

XX The present sequence is that of an RGD-4C peptide having binding

XX affinity to cell surface integrins. DNA encoding a foreign peptide,

XX such as the present sequence, may be introduced into a fiber HI

XX loop-coding gene sequence using a method of the invention for

XX construction of fibre-mutant adenovirus vectors. The fibre HI loop

XX comprises amino acids 537-549 of a fibre molecule. Insertion of a

XX foreign peptide into this region does not affect the formation of a

XX trimers by the fibre molecules. A claimed method for constructing

XX a fibre-mutant adenovirus vector comprises inserting a unique

XX restriction enzyme recognition sequence, especially Csp451 and/or

XX ClaI, into the fibre HI loop-encoding gene, and introducing a

XX foreign peptide-encoding DNA into the gene sequence. The peptide

XX preferably includes the tripeptide Arg-Gly-Asp (RGD) or Asn-Gly-Arg

XX (NGR) and has tropism for tumour vascular endothelial cells.

XX Selection of RGD-4C as the foreign peptide can improve the

XX efficiency of gene introduction not only to adenovirus-sensitive

XX cells but also to e.g. CHO cells, respiratory epithelial cells,

XX smooth muscle cells, vascular endothelial cells, T-cells, macrophages,

XX haematopoietic stem cells, dendritic cells and cancer cells which

XX are CAR-negative but which express integrins on their surfaces, e.g.

XX human glioma IM444 cells. A synthetic oligonucleotide encoding the

XX peptide and including Csp451 and ClaI restriction sites can be

XX ligated directly into the HI loop-coding gene sequence digested with

XX the corresponding restriction enzymes. The fiber-mutant adenovirus

XX vector has high gene transfer efficiency.

DR      A targeting molecule for use in forming complexes to treat cancer, such
XX      as adenocarcinoma of the prostate, comprises a soluble adenoviral
XX      receptor domain, a trimerization domain and a targeting ligand domain -
XX      Example 2; Page 32; 75pp; English.
XX
CC      The invention relates to a targeting molecule that comprises a soluble
CC      adenoviral receptor domain, a trimerisation domain and a targeting ligand
CC      domain. The targeting molecules are used for targeting an adenoviral
CC      particle to a cell expressing a cell surface molecule. The method
CC      involves complexing the adenoviral particle with the targeting molecule
CC      to form a complex, and contacting the cell with the complex, and in
CC      delivering a heterologous gene selectively to a cell. The complex is used
CC      for preparing a medicament for treatment of disease in a human mammal,
CC      such as cancer, preferably, adenocarcinoma of the prostate, by gene
CC      therapy. The present sequence represents a cyclic RGD (CRGD) targeting
CC      ligand domain, used in the targeting molecule of the invention.

 PT kit used for treating cancer comprises peptide compound and anticancer  
 PT and/or radiosensitiser agent -  
 PS  
 PS Disclosure; Page 106; 306pp; English.  
 XX  
 CC The present invention relates to a new kit which comprises a peptide  
 CC compound, an anticancer agent and/or radiosensitiser agent and a carrier.  
 CC The kit of the invention can be used for treating cancer, preferably in  
 CC combination with photodynamic therapy, for tumour imaging and for  
 CC monitoring the progress and results of therapeutic angiogenesis  
 CC treatment. The invention is also used for treating rheumatoid arthritis.  
 CC The present amino acid sequence represents one of a collection of  
 CC peptides (AAU79101-AAU79139) used in the methods of the invention for  
 CC the production of kits used for treating cancer. The present sequence  
 CC binds alpha-v-betas and alpha-v-betas5.

 PT Adenoviral coat protein which permits production of adenoviral vectors

PT that bind and infect host cells not naturally infected by adenovirus,  
 PT comprises various non-native ligands -  
 XX  
 PS Claim 4; Page 40; 45pp; English.  
 XX  
 CC The invention relates to adenoviral coat proteins comprising various  
 CC non-native ligands. The invention provides a method of controlled  
 CC gene expression utilising selectively replication competence and also  
 CC a method and a composition for targeting an adenoviral vector. A  
 CC system comprising a cell having a non-native cell-surface receptor,  
 CC and a virus having a non-native ligand which binds the non-native  
 CC cell-surface receptor of the cell is useful for propagating a virus  
 CC and also for assaying gene function. The system is also useful for  
 CC isolating a nucleic acid encoding a product comprising a desired  
 CC property. Further the system is useful for identifying functionally  
 CC related coding sequences. Adenoviral vector comprising a non-native  
 CC nucleic acid encoding a therapeutic agent such as anti-tumour agent,  
 CC preferably tumour necrosis factor and a second non-native nucleic  
 CC acid encoding an agent that facilitates imaging and a targetting  
 CC agent is useful for treating an animal. The therapeutic agent can be  
 CC used to treat cancer of the brain, lung, ovary, breast and prostate.  
 CC The present sequence is human non-native ligand specific for  
 CC alphavbetas3 integrin, attached to an adenoviral vector.

PT A non-Goodpasture fragment of alpha3(IV)NC1 domain used in detecting  
PT and treating disorders involving angiogenesis -  
XX  
PS Example 45; Page 143; 205pp; English.  
XX  
CC The invention relates to a non-Goodpasture fragment of alpha3(IV)NC1  
CC domain, having one or more of the characteristics selected from:  
CC (a) the ability to bind alphavbeta3 integrin; (b) the ability to inhibit  
CC proliferation of endothelial cells; and (c) the ability to cause  
CC apoptosis of endothelial cells. Also described are the following:  
CC (1) use of Arresten, Canstatin or Tumstatin, or a fragment,  
CC mutant, homologue, analogue or allelic variant in the preparation of a  
CC medicament for treating a disorder involving: (a) inhibiting angiogenesis  
CC in a tissue, where the angiogenesis is mediated by one or more  
CC endothelial cell integrins or one or more endothelial cell integrin  
CC subunits; or (b) by promoting or inducing endothelial cell apoptosis in a

CC tissue, where the endothelial cell apoptosis is mediated by one or more  
CC endothelial cell integrins or one or more endothelial cell integrin  
CC subunits; (2) use of an antibody or peptide that specifically binds the  
CC alpha1, alpha2, alpha3, alpha5, alpha6, alphav, beta1 or beta3  
CC subunit of integrin in the preparation of a medicament for inhibiting  
CC angiogenesis or cell proliferation; (3) use of an inhibitor, such as an  
CC antibody, antibody fragment or peptide of receptor-mediated angiogenesis  
CC in the preparation of a medicament for treating a proliferative disease  
CC in a vertebrate, where the disease is characterised by angiogenesis that  
CC is mediated by receptors to Arresten, Canstatin or Tumstatin and where  
CC the receptors inhibited are Arresten, Canstatin or Tumstatin and where  
CC (4) use of one or more soluble receptors that bind Arresten, Canstatin or  
CC Tumstatin in the presence of a medicament for promoting angiogenesis in a  
CC tissue; and (5) use of integrins in the preparation of a medicament for  
CC promoting or inducing angiogenesis or cell proliferation in a tissue.  
CC The fragments Arresten, Canstatin or Tumstatin and their mutants,  
CC homologues, analogues or allelic variants are useful in the preparation  
CC of a medicament for treating a disorder involving inhibiting angiogenesis  
CC in a tissue, where the angiogenesis is mediated by one or more  
CC endothelial cell integrins or one or more endothelial cell integrin  
CC subunits; or by promoting or inducing endothelial cell apoptosis in a  
CC tissue, where the endothelial cell apoptosis is mediated by one or more  
CC endothelial cell integrins or one or more endothelial cell integrin  
CC subunits. The medicament is useful in inhibiting tumour growth and for  
CC the regression of an established tumour. The present sequence represents  
CC a synthetic peptide used in a binding assay of human type IV collagen  
CC alpha 3 chain mutant, Tumstatin-45-132.

DR Novel vehicle-peptide molecule or its multimers useful for treating  
 PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,  
 PT diabetic retinopathy, obesity, sleep disorders and infertility -

XX Claim 39; Page 47; 176pp; English.

XX The present invention describes a vehicle-peptide molecule (I) or its  
 CC multimers. (I) can have antinflammatory, antitumour, immunosuppressive,  
 CC cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,  
 CC antianaemic, anorectic, antinfertility, haemostatic, dermatological and

CC neuroprotective activities. (I) can be used as a therapeutic or  
 CC prophylactic agent as well as for screening purposes. (I) is useful for  
 CC diagnosing diseases characterised by dysfunction of their associated  
 CC protein of interest, for identifying normal or abnormal proteins of  
 CC interest, as a part of diagnostic kit to detect the presence of their  
 CC proteins of interest in a biological sample. Additionally, (I) is useful  
 CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,  
 CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,  
 CC infertility, and neurological degenerative diseases. (I), comprising  
 CC EPO-mimetic compounds are useful for treating disorders characterised by  
 CC low red blood cell levels such as anaemia. The TPO-mimetic comprising  
 CC compounds are useful for treating conditions that involve an existing  
 CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet  
 CC deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic  
 CC tumour which result in thrombocytopaenia, systemic lupus erythematosus,  
 CC and Fanconi's syndrome. ABR72403 to ABR73426 and ABL35695 to ABL35777  
 CC represent amino acid and nucleic acid sequences used in the  
 CC exemplification of the present invention.

DR Novel vehicle-peptide molecule or its multimers useful for treating  
 PT inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,  
 PT diabetic retinopathy, obesity, sleep disorders and infertility -

XX PS Claim 39: Page 47; 176pp; English.

CC The present invention describes a vehicle-peptide molecule (I) or its  
CC multimers. (I) can have antiinflammatory, antitumour, immunosuppressive,  
CC cytostatic, antirheumatic, antiarthritic, antidiabetic, ophthalmological,  
CC antinausea, anorectic, antifertility, haemostatic, dermatological and  
CC neuroprotective activities. (I) can be used as a therapeutic or  
CC prophylactic agent as well as for screening purposes. (I) is useful for  
CC diagnosing diseases characterised by dysfunction of their associated  
CC protein of interest, for identifying normal or abnormal proteins of  
CC interest, as a part of diagnostic kit to detect the presence of their  
CC proteins of interest in a biological sample. Additionally, (I) is useful  
CC for treating inflammatory and autoimmune diseases, tumour growth, cancer,  
CC rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders,  
CC infertility, and neurological degenerative diseases. (I), comprising  
CC EPO-mimetic compounds are useful for treating disorders characterised by  
CC low red blood cell levels such as anaemia. The EPO-mimetic comprising  
CC compounds are useful for treating conditions that involve an existing  
CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet  
CC deficiency, such as thrombocytopenia, aplastic anaemia, metastatic  
CC tumour which result in thrombocytopenia, systemic lupus erythematosus,  
CC and Fanconi's syndrome. ABB72403 to ABB73426 and ABI33695 to ABL33777  
CC represent amino acid and nucleic acid sequences used in the  
CC exemplification of the present invention.

XX PT New peptide-based compounds useful as a diagnostic imaging agent  
XX comprises affinity for integrin receptors

XX PS Disclosure; Page 5; 63pp; English.

CC The present invention relates to peptide-based compounds which have  
CC affinity for integrin receptors, particularly the integrin alpha2beta3  
CC receptor. These can be used in the manufacture of a contrast medium for  
CC use as a diagnostic imaging agent for generating images of a human or  
CC non-human animal for treating cancer or a related disease, and as  
CC targeting vectors that bind to receptors associated with angiogenesis.  
CC Diseases and indications associated with angiogenesis include  
CC arteriovenous malformations, astrocytomas, choriocarcinomas,  
CC glioblastomas, gliomas, hemangiomas (childhood capillary), hepatomas,  
CC hyperplastic endometrium, ischaemic myocardium, Kaposi sarcoma, macular  
CC degeneration, melanoma, neuroblastomas, occluding peripheral artery  
CC disease, osteoarthritis, psoriasis, retinopathy (diabetic,  
CC proliferative), scleroderma, sematomas, rheumatoid arthritis,  
CC atherosclerosis, inflammation, gingivitis and ulcerative colitis. The  
CC present sequence is a peptide which can be used in a compound of the  
CC invention.

XX selectively homes to a mammalian cell type or tissue linked to an  
XX antimicrobial peptide, useful for the treatment of prostate cancer -  
XX Example 2; Page 79; 118pp; English.

XX The present invention relates to homing pro-apoptotic conjugates,  
XX comprising of a tumour homing molecule that selectively homes to a  
XX mammalian cell type or tissue, linked to an antimicrobial peptide. The  
XX homing pro-apoptotic conjugates are selectively internalised by the  
XX mammalian cell type or tissue and exhibits high toxicity, especially to  
XX angiogenic vasculature. The antimicrobial peptide has low mammalian cell  
XX toxicity when not linked to the tumor homing molecule. The conjugates are

CC useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and  
CC prostate cancer or melanoma. The present sequence is a homing peptide  
CC isolated in the present invention, which can be conjugated to an  
CC antimicrobial peptide to make the homing pro-apoptotic conjugates of the  
CC present invention.

PT Treating unwanted choroidal neovascularization, comprises administering  
PT a photosensitizer that localizes in the neovascularization and irradiating  
PT the neovascularization with laser light to occlude the neovascularization -

XX Example 5; Page 30; 46pp; English.

CC The invention relates to a method for the photodynamic therapy (PDT) of  
CC ocular conditions characterised by the presence of unwanted choroidal  
CC neovascularization (CNV). The method comprises administering a  
CC photosensitizer that localises in the neovascularization and irradiating the  
CC neovascularization with laser light so that the light is absorbed by the  
CC photosensitizer so as to occlude the neovascularization. The method is used  
CC for treating unwanted choroidal neovascularization, particularly of  
CC endothelial cells and ameliorates the symptoms of age-related macular  
CC degeneration (AMD), ocular histoplasmosis syndrome, pathologic myopia,  
CC angiod streaks, idiopathic disorders, choroiditis, choroidal rupture,  
CC overlying choroid nevi and inflammatory diseases. The present sequence is  
CC a peptide motif also known as RGD-4C. This peptide selectively binds to  
CC human alpha-v integrins and accumulates in tumour neovascularization more  
CC effectively than other angiogenesis targeting peptides.

PT A method for constructing a fiber-mutant adenovirus vector in which a  
PT foreign peptide is introduced by a simple system into the fiber HI  
PT loop-coding gene of adenovirus providing a more effective means of  
PT introducing foreign peptides -

XX Example 1; Page 4; 13pp; English.

CC The present sequence is that of an RGD-4C peptide having binding  
CC affinity to cell surface integrins. DNA encoding a foreign peptide,  
CC such as the present sequence, may be introduced into a fiber HI  
CC loop-coding gene sequence using a method of the invention for  
CC construction of fiber-mutant adenovirus vectors. The fiber HI loop  
CC comprises amino acids 537-549 of a fibre molecule. Insertion of a  
CC foreign peptide into this region does not affect the formation of a  
CC trimers by the fibre molecules. A claimed method for constructing  
CC a fibre-mutant adenovirus vector comprises inserting a unique  
CC restriction enzyme recognition sequence, especially Csp45I and/or  
CC ClaI, into the fiber HI loop-coding gene, and introducing a  
CC foreign peptide-encoding DNA into the gene sequence. The peptide  
CC preferably includes the tripeptide Arg-Gly-Asp (RGD) or Asn-Gly-Arg  
CC (NRR) and has tropism for tumour vascular endothelial cells.  
CC Selection of RGD-4C as the foreign peptide can improve the  
CC efficiency of gene introduction not only to adenovirus-sensitive  
CC cells but also to e.g. CHO cells, respiratory epithelial cells,  
CC smooth muscle cells, vascular endothelial cells, T-cells, macrophages,  
CC haematopoietic stem cells, dendritic cells and cancer cells which  
CC are CAR-negative but which express integrins on their surfaces, e.g.  
CC human glioma LN44 cells. A synthetic oligonucleotide encoding the  
CC peptide and including Csp45I and ClaI restriction sites can be  
CC ligated directly into the HI loop-coding gene sequence digested with  
CC the corresponding restriction enzymes. The fiber-mutant adenovirus  
CC vector has high gene transfer efficiency.

PT Mutated adenoviral fiber protein in which an amino acid in the CD loop  
 of the wild-type protein has been mutated to reduce the ability of the  
 protein to bind to coxsackievirus-adenovirus receptor, useful for  
 therapeutic purposes -

PS Disclosure; Page 144; 144pp; English.

XX The invention relates to a mutated adenoviral fibre protein in which at  
 least one amino acid in the CD loop of a wild-type fibre protein of an  
 adenovirus from subgroup C, D or E, or the long wild-type fibre of an  
 adenovirus from subgroup F, has been mutated to reduce or substantially  
 eliminate the ability of the fibre protein to bind to the  
 coxsackievirus-adenovirus receptor (CAR). Adenoviral particles of the  
 invention are useful for expressing a heterologous polynucleotide in a  
 cell, preferably a mammalian cell such as a primate cell or a human  
 cell. They are also useful for enhancing adenoviral-mediated gene  
 transfer to and expression in hepatocytes. They are also useful to  
 genetically engineer a cell to express a protein that it otherwise does  
 not express or does not express in sufficient quantities, and in gene  
 therapy for treating diabetes, haemophilia, anglogenesis, and diseases  
 related to increased cholesterol or triglyceride blood levels in a  
 patient such as atherosclerosis. The current sequence represents the  
 cyclic RGD peptide consensus sequence.

DR Transfecting confluent cells with nucleic acid for gene therapy or gene

XX vaccination, comprises contacting the cells with a receptor-targeted

PT vector having the nucleic acid and an agent that disrupts cell-cell

PT junctions -

PS Claim 17; Page 17; 11pp; English.

XX The invention describes transfecting (I) confluent cells or other slowly  
 dividing or non-dividing cells that are in contact with each other, with  
 a nucleic acid. The method comprises contacting the cells with a  
 receptor-targeted vector comprising the nucleic acid, and an agent that  
 disrupts cell-cell junctions under conditions suitable to effect  
 transfection. (II) is useful for transfecting bronchial and lung  
 epithelium for gene therapy for cystic fibrosis, asthma and also various  
 cancers and viral infections e.g. human immunodeficiency virus (HIV)  
 infection. Haematopoietic cell transfection enables gene therapy, gene  
 vaccination and anti-sense therapy of diseases involving haematopoietic  
 cells, including leukemia and bone marrow stem cell disorders.  
 Transfection of corneal endothelium is useful for treatment of eye  
 disease affecting the cornea or corneal organ transplants, for e.g. in  
 glaucoma. A gene preventing cell proliferation in blood vessel walls is  
 introduced using an integrin targeting transfection vector complex (II)  
 to reduce restenosis. (III) is useful for intracellular transport and  
 delivery of anti-sense oligonucleotides, which enables antiviral and  
 cancer therapy and is effective in transporting large DNA molecules.  
 This sequence represents a peptide that will permit cyclisation by  
 disulfide bond formation. It contains the conserved RGD amino acid  
 sequence that binds to integrins with high affinity, allowing the nucleic  
 acid to pass into the cell, described in the method of the invention.

Complex for transfecting cell with nucleic acid for treating,  
 preventing conditions caused by deficiency in a gene in humans, has  
 nucleic acid, lipid, integrin binding and polycationic nucleic  
 acid-binding components -

Claim 15; Page 78; 108pp; English.

The invention relates to integrin-targeting vectors having enhanced  
 transfection activity. The vector complex comprises a nucleic acid,  
 an integrin binding component, a polycationic nucleic acid-binding  
 component and a lipid component. The integrin binding component  
 comprises an integrin-binding element and a spacer element. Complex  
 of the invention is useful for transfecting cells in vitro or in  
 vivo with a nucleic acid, for treatment or prophylaxis of a condition  
 caused in human or a non-human animal by a defect and/or a deficiency  
 in a gene, immunisation and antisense therapy of a human or a non-human  
 animal. It is useful for transfecting bronchial and lung epithelium and  
 corneal endothelium for gene therapy for cystic fibrosis, asthma and  
 also various cancers and viral infections for example human  
 immunodeficiency virus (HIV) infection. It is also useful as a vaccine  
 or for therapy of neuroblastoma and the effective transfection of  
 CC primary smooth muscle cells, cardiac myocytes and hematopoietic cells.  
 CC Hematopoietic cell transfection enables gene therapy, gene vaccination  
 CC and antisense therapy of diseases involving hematopoietic cells,

CC including leukaemia and bone marrow stem cell disorders, for example  
 CC transfection of a cytokine gene may be used for adjuvant immunotherapy.  
 CC Transfection of corneal endothelium is useful for treatment of eye  
 CC disease affecting the cornea or corneal organ transplants, for example  
 CC in glaucoma. A gene that prevents proliferation of cells in blood  
 CC vessel walls is introduced using complex of the invention to reduce  
 CC restenosis. The present sequence is cyclic integrin-binding peptide  
 CC of the invention.

High affinity integrin binding peptides - can be used to attach  
 PT cells to a substrate, inhibit the attachment of osteoclasts to bone,  
 PT promote wound healing, inhibit angiogenesis, metastasis of tumours  
 PT and migration of smooth muscle cells

XX Example 1; Page 23; 86pp; English.

The sequences given in AAR76185-200 and AAR79073-94 are high affinity  
 CC integrin binding peptides which bind to various integrins. Peptides  
 CC which bind to alpha5/beta1 integrins contain the motifs given in  
 CC AAR76185-86 and peptides which bind to alphaV/beta5 and alphaV/beta3  
 CC integrins contain the motif given in AAR76187. AlphaV/beta5 integrins  
 CC are also bound by RGD containing peptides. These peptides assume a  
 CC conformationally stabilised configuration which is due to the  
 CC formation of a disulphide bond, a peptide bond or a lactam bond.  
 CC These peptides may be used for isolating the complementary integrin  
 CC from a sample mixture by contacting them under ionic conditions to  
 CC allow binding of the integrin to the peptide and then separating the  
 CC integrin from the peptide. They can be used for attaching cells to  
 CC a substrate, by binding them to the substrate with the cell. The  
 CC peptides promote wound healing when applied locally and inhibit the

CC attachment of osteoclasts to bone. They inhibit angiogenesis,  
 CC metastasis of tumours and migration of smooth muscle cells.

XX Tumour homing molecules and their conjugates - useful for, e.g.  
 PT directing linked moiety to tumour containing angiogenic vasculature

XX Example 3; Page 75; 105pp; English.

CC The present peptide represents a tumour homing peptide, and is produced  
 CC by in vivo panning. The peptide contains the motif Arg-Gly-Asp (RGD). The  
 CC in vivo panning comprises administering a library of diverse peptides to  
 CC a subject having a tumour, collecting a sample of the tumour, identifying  
 CC a peptide that homes to the tumour, collecting a sample of normal tissue  
 CC corresponding to the tumour, and determining that the peptide that homes  
 CC to the tumour is not present in the normal tissue. The tumour homing  
 CC peptide can be linked to a moiety (e.g. doxorubicin), and used to direct  
 CC the moiety to a tumour.

XX Inhibition of angiogenesis by superfibronectin - useful for  
 PT treating, e.g. psoriasis, rheumatoid arthritis and various cancers  
 XX  
 PS Example 9; Page 63; 105pp; English.

XX A method has been developed of ameliorating cancer, or inhibiting  
 CC angiogenesis, in a subject. The method comprises administering a  
 CC superfibronectin or a superfibronectin-generating compound. The  
 CC present sequence represents a peptide used in an example of the  
 CC present invention. The method can be used to treat cancer, ocular  
 CC neovascularisation, diabetic retinopathy, haemangioma, rheumatoid  
 CC arthritis, psoriasis, granuloma, and granulation tissue. The cancer  
 CC treated by the method can comprise a solid tumour, such as a melanoma,  
 CC osteosarcoma, ovarian, vascular or epithelial cell tumour. When it is in  
 CC an epithelial cell tumour, it is preferably a colon carcinoma, breast  
 CC carcinoma, or ovarian carcinoma. When it is a vascular cell tumour, it is  
 CC selected from haemangiomas, Kaposi's sarcoma, lymphangioma, glomangioma,  
 CC angiosarcoma, or haemangioendothelioma. The method inhibits or prevents  
 CC a tumour cell, metastasis in a subject especially inhibits the tumour  
 CC cell migration, attachment, or inhibiting growth of a tumour cell in a  
 CC subject having a pathology with an angioproliferative component, where  
 CC the inhibition causes regression of the pathology. The route of  
 CC administration is intravenous, intramuscular, intradermal, subcutaneous,  
 CC intracranial, intracerebrospinal, epidural, topical or oral  
 CC administration.

XX

PT New soluble derivative of anti-angiogenic polypeptide useful for  
 PT treatment of primary or secondary cancers, contains covalently attached  
 PT membrane-binding elements for targeting  
 XX  
 PS Claim 13; Page 32; 36pp; English.

XX The present sequence is a claimed example of a disulfide-constrained  
 CC peptide that can be used as a membrane binding element (MBE) in  
 CC novel soluble derivatives (I) of anti-angiogenic polypeptides of  
 CC the invention. The peptide was identified using a phage display  
 CC technique. (I) comprise 2 or more heterologous MBES with low  
 CC membrane affinity that are covalently attached to a soluble  
 CC anti-angiogenic polypeptide such as a non-catalytic region of human  
 CC plasminogen, fragments of related proteins containing Kringle  
 CC domains, fragments of collagen or prolactin, neutralising  
 CC antibodies against receptors for angiogenic mediators, and  
 CC antagonists of integrins involved in angiogenesis. The MBES  
 CC interact independently with thermodynamic additivity, with  
 CC components of the vascular endothelium. (I) provide targeted  
 CC delivery of the anti-angiogenic polypeptide to cell membranes and  
 CC sites of active angiogenesis, particularly the vascular endothelium,  
 CC and therefore increase the local concentration and reduce the risk  
 CC of adverse effects on normal processes elsewhere in the vasculature.  
 CC They are used in a claimed method of treatment of primary or  
 CC secondary tumour.

PT Novel isolated nucleic acid, useful for gene therapy

PS Example 10; Page 83; 190pp; English.

XX

CC The specification describes mutant retrovirus envelope (env) proteins.  
CC The envelope protein coding sequence can be mutated to encode a mutant  
CC envelope protein with a substitution of one or more amino acids in at  
CC least one motif of the retrovirus protein. The mutant protein fragment  
CC allows for decreased shedding of the surface protein by suppressing  
CC precursor cleavage and increase envelope stability and fusion of  
CC retroviruses with cell membranes, while maintaining mutant envelope  
CC protein incorporation into a virion, and viral titers of about two orders  
CC of magnitude within that observed for wild-type retrovirus when the  
CC protein or fragment is expressed on the surface of a retroviral particle.  
CC The proteins have an increased ability to penetrate targets, typically  
CC cells and a correspondingly increased ability to deliver nucleic acids or  
CC drugs. The mutated nucleic acid is useful for gene and drug therapy.  
CC especially as drug delivery vehicles. The retrovirus particles can be  
CC utilized to transduce eukaryotic cells. The transduced cells are useful  
CC in the treatment of cancer in a human. Other diseases contemplated for  
CC treatment include adenosine deaminase deficiency (ADA), thalassemia,  
CC hemophilia, diabetes, alpha-anti trypsin deficiency, brain and neural  
CC disorders, phenylketonuria, growth disorders, heart diseases and immune  
CC diseases. The present sequence was used to inhibit attachment of  
CC the envelope protein to Alphavetals Integrin, in the course of the  
CC invention.

XX Novel modified virus comprising non-native polypeptides with stable  
XX conformation and having framework moieties containing binding moieties  
XX which confer upon the virus, an altered tropism, useful in gene therapy

XX Example 11; Page 69; 163pp; English.

XX The invention describes a modified virus comprising non-native  
XX polypeptides which has framework moieties each conferring by the binding  
XX moieties, where the virus has altered tropism conferred by the binding  
XX moieties. The polypeptides can be expressed in the cytoplasm and nucleus  
XX of mammalian host cell in conformation which is maintained in absence of  
XX ligands for the binding moieties, where the conformation allows the  
XX binding moiety subsequently to bind with the ligand. The modified virus  
XX is useful in therapy for the preparation of a medicament for treating  
XX tumour cells, cancer, proliferating cells, vascular diseases,  
XX inflammatory diseases and infectious diseases such as Human  
XX immunodeficiency virus (HIV). The altered tropisms allow the virus to be  
XX used in treatment of disease in human or animal subjects, either by in  
XX vivo treatment of, or ex vivo treatment of cells of, the subject  
XX requiring treatment. The problems associated with the expression of  
XX functional non-native viral components in the nucleus and cytosol of  
XX host cells is solved by using the modified virus for the purpose. This  
XX sequence represents a peptide sequence used in the creation of the  
XX modified virus containing non-native polypeptides.

PT New integrin-targeting transfection complex including lipid - used  
PT to improve transfection efficiency for a very wide range of cells,  
PT useful in, e.g. antisense therapy and genetic immunisation  
XX  
XX Claim 9; Page 49; 70pp; English.  
XX  
XX The invention relates to an integrin-targeting transfection complex. The  
CC complex comprises a nucleic acid, an integrin-binding component, a  
CC polycationic nucleic acid-binding component and a lipid. The complexes  
CC are used for in vivo or in vitro transfection of cells, specifically:  
CC (i) for treatment or prevention of disease (in humans or other animals)  
CC caused by defective or deficient genes; (ii) for immunisation; (iii) for  
CC antisense therapy, and (iv) for protein production in host cells, e.g.  
CC of enzymes, therapeutic agents, vaccinating immunogens and diagnostic  
CC antigens. Typical of the diseases that can be treated or prevented are  
CC cystic fibrosis, cancer, viral infection (e.g. human immunodeficiency  
CC virus), cardiovascular disease (e.g. restenosis), leukaemia, asthma and  
CC glaucoma. Incorporation of the lipid into the complex increases  
CC transfection levels from 1-10 percent to over 50 percent. This effect is  
CC observed with all cell types tested including those that are resistant to  
CC transfection by most plasmid vectors. The complexes can carry large  
CC genes, up to 125 kb, e.g. an artificial chromosome. The present sequence  
CC represents a claimed example of an integrin-binding peptide used in the  
XX transfection complexes.

PS Disclosure; Page 5; 108pp; English

The invention relates to integrin-targeting vectors having enhanced transfection activity. The vector complex comprises a nucleic acid, an integrin binding component, a polycationic nucleic acid-binding component and a lipid component. The integrin binding component comprises an integrin-binding element and a spacer element. Complex of the invention is useful for transfecting cells in vitro or in vivo with a nucleic acid, for treatment or prophylaxis of a condition caused in human or a non-human animal by a defect and/or a deficiency in a gene, immunisation and antisense therapy of a human or a non-human animal. It is useful for transfecting bronchial and lung epithelial and corneal endothelium for gene therapy for cystic fibrosis, asthma and also various cancers and viral infections, for example human immunodeficiency virus (HIV) infection. It is also useful as a vaccine or for therapy of neuroblastoma and the effective transfection of primary smooth muscle cells, cardiac myocytes and haematopoietic cells. Haematopoietic cell transfection enables gene therapy, gene vaccination and antisense therapy of diseases involving haematopoietic cells, including leukaemia and bone marrow stem cell disorders, for example transfection of a cytokine gene may be useful for adjuvant immunotherapy. Transfection of corneal endothelium is useful for treatment of eye disease affecting the cornea or corneal organ transplants, for example in glaucoma. A gene that prevents proliferation of cells in blood vessel walls is introduced using complex of the invention to reduce restenosis. The present sequence is cyclic integrin-binding peptide of the invention.

PT Urokinase-type plasminogen activator receptor (UPAR)-targeted  
PT adenovirus vectors having modified hexon HVR5 and HI loops and modified  
PT fiber proteins useful for targeted gene therapy to treat cancer or  
PT restenosis -

PS Claim 15; Page 69; 128pp; English

This sequence represents a targeting sequence for UPR, and is flanked by linkers. The invention relates to an adenovirus from which at least a part of the hexon HVR5 or HI loop is replaced with a binding peptide, or targeting sequence, flanked by connecting amino acid spacers, to functionally display its binding specificity at the capsid surface. The invention also relates to a recombinant adenovirus vector where a binding peptide, or targeting sequence, is connected to the C-terminus of the fiber by a connecting spacer, or linker, so as to functionally display its binding specificity at the capsid surface. The adenovirus or recombinant adenovirus vector can be used to preferentially express a gene in a target cell, especially a cell that expresses a UPR. The targeted adenovirus vector preferably comprises a heterologous gene encoding a gene for treatment of a tumour or restenosis. The targeted adenovirus vector is useful for gene therapy treatment of a disease, and for manufacturing a medicine used in gene therapy treatment of a disease. The viruses can also be used to inhibit smooth muscle cell proliferation, to treat peripheral artery diseases, coronary artery diseases, obesity, neurodegenerative diseases, infections, autoimmune diseases, asthma, HIV, thrombosis, and diabetes. The viruses are particularly targeted against a urokinase-type plasminogen activator receptor (UPAR). The adenoviruses are tropism-modified without adversely impacting productivity of the vectors.

PS  
XX This invention relates to a novel method for preparing peptide linked  
CC oligomeric compounds by deprotecting the hydroxyl groups of a compound  
CC derivatising support medium, reacting deprotected hydroxyl groups with  
CC a nucleoside to form a compound from which a capped compound is formed,  
CC oxidized and cleaved to form an oligomeric compound having a reactive  
CC sulfur moiety. The reactive sulphur moiety is reacted with peptide  
CC with functional group reactive with sulfur moiety, to form a peptide  
CC linked oligomeric compound. The method of the invention is useful for  
CC preparing an oligomeric compound. The oligomeric compounds can be used  
CC in diagnostics, therapeutics and as research reagents and kits. They can  
CC also be used in pharmaceutical compositions by including a suitable  
CC diluent or carrier. The oligomeric compounds of the invention can  
CC further be used for treating organisms having a disease characterised by  
CC the undesired production of a protein. This method is suitable for large  
CC scale synthesis of oligomeric compounds, the methods provide improved  
CC synthetic schemes which avoid the problem of prior art. The synthetic  
CC methods employed equimolar amounts of functionalised oligomeric  
CC compounds and peptide reagents which has successfully resulted in large  
CC scale synthesis. This scaled up synthesis is significantly larger than  
CC any synthesis method described previously. The methods are highly  
CC economical. The present sequence represents a peptide used in the  
CC creation of a peptide linked oligomeric compound of the invention.  
CC this peptide may undergo random oxidation of the Cys residues and  
CC is likely to form intermolecular aggregates.

Adenoviral vectors containing chimeric coat protein - bind and enter  
cells more efficiently, useful for gene therapy of e.g. cancer,  
autoimmune diseases, etc.

Example 19; Page 77; 121pp; English.

This peptide comprises an RGD peptide motif contained in the  
adenoviral vector Adz.F(RGD). The growth behaviour of this  
vector was compared to that of wild-type adenovirus Ad5 and of  
vector Adz.F(pk7), which contains a universal transfer vector  
(UTV) sequence. 293 cells were infected with the vectors.  
The peaks titres of Adz.F(RGD) and Adz.F(pk7) were 80% and 56%,  
respectively, that of Ad5. The results confirm that the growth  
kinetics of the 2 vectors were not substantially affected by  
addition of sequences, particularly a UTV or UTV-like sequence,  
onto the end of the fibre protein. Chimeric adenovirus coat  
proteins containing UTV sequences (see AAW19810-11, AAW19813-25,  
AAW19834-43) facilitate entry of adenoviral vectors into target  
cells. The vectors can be used for the gene therapy of e.g.  
cancer, autoimmune diseases, pathogenic infections, heart disease  
and genetic disorders.

Chimeric adenovirus fibre proteins - containing non-native amino  
acid sequence to provide for binding and entry into cells,  
especially for gene therapy

Claim 7; Page 88; 124pp; English.

The present sequence represents a specifically claimed non-native amino  
acid sequence from a chimeric adenovirus fibre protein (AFP) of the  
present invention. The non-native amino acid sequence allows the  
chimeric fibre (or a vector comprising the chimeric fibre) to more  
efficiently bind to and enter cells. The products can be used for gene  
therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as  
well as genetic disorders, e.g. cystic fibrosis, haemophilia and  
muscular dystrophy as well as pathogenic infections, e.g. HIV,  
CC tuberculosis and hepatitis and also for heart disease, to e.g. prevent  
restenosis following angioplasty or to promote angiogenesis to reperfuse  
necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease,  
colitis, rheumatoid arthritis, and Alzheimer's disease.

 CC This sequence represents a RGD-containing peptide that can be used in a  
 CC bifunctional complex used in the nucleic acid delivery vehicle (1) of the  
 CC invention. (1) is for transfecting and/or infecting a target cell, and  
 CC comprises a transgene and a bifunctional complex (B) that targets the  
 CC nucleic acid delivery vehicle to the cell surface. (B) comprises a  
 CC delivery vehicle binding portion, a cell surface molecule binding portion  
 CC (such as this sequence) and a linker connecting them. The delivery  
 CC vehicle can be specifically targeted to the cell via the binding to cell  
 CC surface molecules. (1) can be used to target cells, which express  
 CC integrins such as, HT-29 colon carcinoma cells, lymphocytes and  
 CC monocytes, blood platelets, SMC-90 human lung fibroblast, MC63)  
 CC osteosarcoma cell line, vascular endothelial cells and melanoma cells.  
 CC (1) is useful for delivery of nucleic acids encoding CFTR (cystic  
 CC fibrosis transmembrane regulator), alpha1 antitrypsin,  
 CC beta-glucocerebrosidase and suicide genes. The construct increases the  
 CC efficiency of cellular uptake of (1). The constructs also enable the  
 CC transfection/infection of cells that are normally refractory to  
 CC transfection/infection by targeting cell receptors that are present on  
 CC such cells.

| CC                      | The specification describes mutant retrovirus envelope proteins. The        |
| CC                      | envelope protein coding sequence can be mutated to encode a mutant          |
| CC                      | envelope protein with a substitution of one or more amino acids in at       |
| CC                      | least one motif of the retrovirus protein. The mutant protein fragment      |
| CC                      | allows for decreased shedding of the surface protein by suppressing         |
| CC                      | retrovirus cleavage and increase envelope stability and fusion of           |
| CC                      | retroviruses with cell membranes, while maintaining mutant envelope         |
| CC                      | protein incorporation into a virion, and viral titers of about two orders   |
| CC                      | of magnitude within that observed for wild-type retroviruses when the       |
| CC                      | protein or fragment is expressed on the surface of a retroviral particle.   |
| CC                      | The proteins have an increased ability to penetrate targets, typically      |
| CC                      | cells and a correspondingly increased ability to deliver nucleic acids or   |
| CC                      | drugs. The mutated nucleic acid is useful for gene and drug therapy,        |
| CC                      | especially as drug delivery vehicles. The retrovirus particles can be       |
| CC                      | utilized to transduce eukaryotic cells. The transduced cells are useful     |
| CC                      | in the treatment of cancer in a human. Other diseases contemplated for      |
| CC                      | treatment include adenosine deaminase deficiency (ADA), thalassemia,        |
| CC                      | hemophilia, diabetes, alpha-anti trypsin deficiency (AAT), brain and neural |
| CC                      | disorders, phenylketonuria, growth disorders, heart diseases and immune     |
| CC                      | diseases. The present sequence is inserted between Ser6 and Pro7 of         |
| CC                      | the Mooney murine leukemia virus envelope protein, in the course of the     |

PT especially for gene therapy  
 XX  
 PS Claim 7; Page 82; 124pp; English.  
 CC  
 CC The present sequence represents a specifically claimed non-native amino  
 CC acid sequence from a chimeric adenovirus fibre protein (AFP) of the  
 CC present invention. The non-native amino acid sequence allows the  
 CC chimeric fibre (or a vector comprising the chimeric fibre) to more  
 CC efficiently bind to and enter cells. The products can be used for gene  
 CC therapy, for treating cancer, e.g. melanoma, glioma and lung cancers as  
 CC well as genetic disorders, e.g. cystic fibrosis, haemophilia and  
 CC muscular dystrophy as well as pathogenic infections, e.g. HIV,  
 CC tuberculosis and hepatitis and also for heart disease, to e.g. prevent  
 CC restenosis following angioplasty or to promote angiogenesis to reperfuse  
 CC necrotic tissue, and in autoimmune disorders, e.g. Crohn's disease,  
 CC colitis, rheumatoid arthritis, and Alzheimer's disease.

 PT Homing pro-apoptotic conjugate comprising a tumor homing molecule that  
 PT selectively homes to a mammalian cell type or tissue linked to an  
 PT antimicrobial peptide, useful for the treatment of prostate cancer -  
 XX  
 PS Disclosure; Page 8; 118pp; English.  
 XX  
 CC The present invention relates to homing pro-apoptotic conjugates,  
 CC comprising of a tumour homing molecule that selectively homes to a  
 CC mammalian cell type or tissue, linked to an antimicrobial peptide. The  
 CC homing pro-apoptotic conjugates are selectively internalised by the

CC mammalian cell type or tissue and exhibits high toxicity, especially to  
 CC angiogenic vasculature. The antimicrobial peptide has low mammalian cell  
 CC toxicity when not linked to the tumor homing molecule. In addition, the  
 CC antimicrobial peptide has an amphipathic alpha-helical structure. The  
 CC conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma,  
 CC breast and prostate cancer or melanoma. The present sequence is one such  
 CC homing pro-apoptotic conjugate.

 PT Transfecting confluent cells with nucleic acid for gene therapy or gene  
 PT vaccination, comprises contacting the cells with a receptor-targeted  
 PT vector having the nucleic acid and an agent that disrupts cell-cell  
 PT junctions -  
 XX  
 XX Example 1: Page 43; 111pp; English.  
 CC The invention describes transfecting (I) confluent cells or other slowly  
 CC dividing or non-dividing cells that are in contact with each other, with  
 CC a nucleic acid. The method comprises contacting the cells with a  
 CC receptor-targeted vector comprising the nucleic acid, and an agent that  
 CC disrupts cell-cell junctions under conditions suitable to effect  
 CC transfection. (I) is useful for transfecting bronchial and lung  
 CC epithelium for gene therapy for cystic fibrosis, asthma and also various  
 CC cancers and viral infections e.g. human immunodeficiency virus (HIV)  
 CC infection. Hematopoietic cell transfection enables gene therapy, gene  
 CC vaccination and anti-sense therapy of diseases involving haematopoietic  
 CC cells, including leukaemia and bone marrow stem cell disorders.  
 CC Transfection of corneal endothelium is useful for treatment of eye  
 CC disease affecting the cornea or corneal organ transplants, for e.g. in  
 CC glaucoma. A gene preventing cell proliferation in blood vessel walls is  
 CC introduced using an integrin targeting transfection vector complex (II)  
 CC to reduce restenosis. (II) is useful for intracellular transport and  
 CC delivery of anti-sense oligonucleotides, which enables antiviral and  
 CC cancer therapy and is effective in transporting large DNA molecules.  
 CC This sequence represents a cyclic peptide containing the conserved RGD  
 CC amino acid sequence that binds with high affinity to integrins to allow  
 CC the nucleic acid to pass into the cell, described in the method of the  
 CC invention.

 PT Complex for transfecting cell with nucleic acid for treating,  
 PT preventing conditions caused by deficiency in a gene in humans, has  
 PT nucleic acid, lipid, integrin binding and polycationic nucleic  
 PT acid-binding components -  
 XX  
 XX Example 5; Page 33; 108pp; English.  
 PS The invention relates to integrin-targeting vectors having enhanced  
 CC transfection activity. The vector complex comprises a nucleic acid,  
 CC an integrin binding component, a polycationic nucleic acid-binding  
 CC component and a lipid component. The integrin binding component  
 CC comprises an integrin-binding element and a spacer element. Complex  
 CC of the invention is useful for transfecting cells in vitro or in  
 CC vivo with a nucleic acid, for treatment or prophylaxis of a condition  
 CC caused in human or a non-human animal by a defect and/or a deficiency  
 CC in a gene, immunisation and antisense therapy of a human or a non-human  
 CC animal. It is useful for transfecting bronchial and lung epithelium and  
 CC corneal endothelium for gene therapy for cystic fibrosis, asthma and  
 CC also various cancers and viral infections for example human  
 CC immunodeficiency virus (HIV) infection. It is also useful as a vaccine  
 CC or for therapy of neuroblastoma and the effective transfection of  
 CC primary smooth muscle cells, cardiac myocytes and hematopoietic cells.  
 CC Hematopoietic cell transfection enables gene therapy, gene vaccination  
 CC and antisense therapy of diseases involving haematopoietic cells,  
 CC

CC Including leukemia and bone marrow stem cell disorders, for example  
CC transfection of a cytokine gene may be useful for adjuvant immunotherapy.  
CC Transfection of corneal endothelium is useful for treatment of eye  
CC disease affecting the cornea or corneal organ transplants, for example  
CC in glaucoma. A gene that prevents proliferation of cells in blood  
CC vessel walls is introduced using complex of the invention to reduce  
CC restenosis. The present sequence is integrin-targeting oligolysine  
CC peptide used in the exemplification of the invention.

New adenoviral fibre trimer with reduced binding to native substrate

- useful for, e.g. preparing gene therapy vector with minimal

ectopic infection for in vitro applications

Example 8; Page 59-60; 103pp; English.

This sequence represents a novel adenovirus chimeric protein, SCAR.RGD.

This protein is used in a method for the construction of novel monomers

having an N-terminus of an adenoviral fibre protein and a trimerisation

domain. Such monomers have lower affinity for native substrate than the

native adenoviral fibre trimer. Cell lines containing such monomers are

used (i) to propagate adenovirus for use as gene therapy vectors (for in

vivo or in vitro applications, (ii) as reagents for studying adenoviral

attachment and infection, and (iii) in receptor-ligand interaction

assays. The new viruses produce minimal ectopic infection (they can not

infect native host cells) so are safer as vectors and can be engineered

for selective targeting to other cells.

PS Claim 21: Page 62; 86pp; English.  
XX  
CC The sequences given in AAR76185-200 and AAR79073-94 are high affinity  
CC integrin binding peptides which bind to various integrins. Peptides  
CC which bind to alpha5/beta1 integrins contain the motifs given in  
CC AAR76185-86 and peptides which bind to alphaV/beta3 and alphaV/beta3  
CC integrins contain the motif given in AAR76187. AlphaV/beta3 integrins  
CC are also bound by RGD containing peptides. These peptides assume a  
CC conformationally stabilised configuration which is due to the  
CC formation of a disulphide bond, a peptide bond or a lactam bond.  
CC These peptides may be used for isolating the complementary integrin  
CC from a sample mixture by contacting them under ionic conditions to  
CC allow binding of the integrin to the peptide and then separating the  
CC integrin from the peptide. They can be used for attaching cells to  
CC a substrate, by binding them to the substrate with the cell. The  
CC peptides promote wound healing when applied locally and inhibit the  
CC attachment of osteoclasts to bone. They inhibit angiogenesis,  
CC metastasis of tumours and migration of smooth muscle cells.

XX Claim 6; Page 91; 105pp; English.  
XX  
XX The present peptide represents a tumour homing peptide, and is produced  
XX by in vivo panning. The peptide has an alpha-V-containing integrin  
XX binding motif, Arg-Gly-Asp (RGD). The in vivo panning comprises  
XX administering a library of diverse peptides to a subject having a  
XX tumour, collecting a sample of the tumour, identifying a peptide that

CC homes to the tumour, collecting a sample of normal tissue corresponding  
CC to the tumour, and determining that the peptide that homes to the  
CC tumour is not present in the normal tissue. The tumour homing peptide can  
CC be linked to a moiety (e.g. doxorubicin), and used to direct the  
CC moiety to a tumour.

PT Nucleic acid delivery vehicles useful for transfecting and infecting a  
 target cell -  
 PS Claim 22; Page 39; 118pp: English.

CC This sequence represents a RGD-containing peptide that can be used in a  
 CC bifunctional complex used in the nucleic acid delivery vehicle (I) of the  
 CC invention. (I) is for transfecting and/or infecting a target cell, and  
 CC comprises a transgene and a bifunctional complex (B) that targets the  
 CC nucleic acid delivery vehicle to the cell surface. (B) comprises a  
 CC delivery vehicle binding portion, a cell surface molecule binding portion  
 CC (such as this sequence) and a linker connecting them. The delivery  
 CC vehicle can be specifically targeted to the cell via the binding to cell  
 CC surface molecules. (I) can be used to target cells, which express  
 CC integrins such as, HT-29 colon carcinoma cells, lymphocytes and  
 CC monocytes, blood platelets, SMC-90 human lung fibroblast, MC63)  
 CC osteosarcoma cell line, vascular endothelial cells and melanoma cells.  
 CC (I) is useful for delivery of nucleic acids encoding CFTR (cystic  
 CC fibrosis transmembrane regulator), alpha1-antitrypsin,  
 CC beta-glucocerebrosidase and suicide genes. The construct increases the  
 CC efficiency of cellular uptake of (I). The constructs also enable the  
 CC transfection/infection of cells that are normally refractory to  
 CC transfection/infection by targeting cell receptors that are present on  
 CC such cells.

PT New peptides which selectively home to organs or tissues, used for,  
 PT e.g. identifying target ligands and for therapy of pathological  
 PT conditions -  
 PS Example 6; Page 149; 193pp: English.

CC The present invention describes peptides that selectively home to a  
 CC tissue or organ. The peptides can be used for identifying an organ or  
 CC tissue, for identifying a target molecule expressed by an organ or  
 CC tissue or for treating an organ or tissue pathology, where the organ or  
 CC tissue is selected from prostate, lung, skin, retina, pancreas, gut,  
 CC ovary, adrenal gland, liver, and lymph node. The peptide bind to the  
 CC membrane dipeptidase (MDP). AAY48618 to AAY49066 represent sequences  
 CC which are used in the exemplification of the present invention.

 XX  
 XX Recombinant adenovirus vectors with modified fiber knob loops, useful  
 PT in gene therapy

Example 21; Page 49; 126pp; English.

CC This sequence represents a synthetic RGD-4C peptide. DNA encoding  
 CC this sequence was cloned into the sequence encoding the HI loop of the  
 CC adenovirus fibre protein knob domain. This was then used in the  
 CC construction of plasmids encoding a modified fibre protein. Recombinant  
 CC adenovirus genomes were generated by homologous DNA recombination in E.  
 CC coli, before excision of the newly generated genome for virus rescue.  
 CC The knob domain of the adenovirus fibre protein mediates the initial  
 CC binding and recognition of the coxsackievirus and adenovirus receptor  
 CC (CAR) on the cell surface. The HI loop protrudes from the knob domain  
 CC and connects beta-strands involved in the formation of the cell binding  
 CC site. Recombinant adenovirus vectors are used in a number of gene  
 CC therapy applications; however, the reliance on the CAR means that  
 CC in certain situations, recombinant viruses are sequestered by high  
 CC CAR-expressing non-target cells while the true target cells, if low  
 CC in CAR, receive little of the therapeutic gene. Modification of the HI  
 CC loop by replacement of the hypervariable region of the loop with a  
 CC peptide such as the RGD peptide results in the  
 CC ability of the virus to utilise an alternative receptor during the cell  
 CC entry process. Modifying the adenovirus fibre knob protein in this way  
 CC increases the ability of an adenovirus to transduce a tumour cell in  
 CC vitro, in vivo and ex vivo. The vector Ad5FHFRLRG incorporating an RGD  
 CC peptide demonstrated two to three orders of magnitude  
 CC of increased gene transfer to ovarian cancer cells. The modified  
 CC adenovirus has an altered tropism, which allows the adenovirus to be  
 CC targeted to selected cell types. The recombinant adenovirus can be used  
 CC to provide gene therapy for individuals suffering from cancer, cystic  
 CC fibrosis and Duchenne's muscular dystrophy.

Identifying molecules that home to angiogenic vasculature used as  
 targets for anticancer agents

Claim 15; Page 7; 180pp; English.

CC This invention describes novel peptides which home to angiogenic  
 CC vasculature, specifically of a tumour and which have anti-tumour,  
 CC anti-inflammatory, anti-angiogenic and anti-arthritis activity. Such  
 CC molecules are identified by treating a purified NGR receptor with a test  
 CC compound and identifying compounds that bind specifically to the NGR  
 CC receptor. The peptides of the invention are inhibitors of angiogenesis  
 CC and can be used to produce conjugates for delivering agents to  
 CC angiogenic vasculature, particularly anticancer drugs or an imaging  
 CC agent, for diagnosis or prognosis. These conjugates may be directed to  
 CC non-tumour angiogenic vasculature, e.g. that present in inflammatory,  
 CC regenerating or wounded tissue, e.g. for treatment of macular  
 CC degeneration, diabetic retinopathy or rheumatoid arthritis. The peptides  
 CC provide specific targeting to tumours, especially their supporting  
 CC vasculature, since the NGR receptor is exposed to the circulation only in  
 CC angiogenic vasculature. Precise targeting should reduce the systemic  
 CC toxicity of anticancer drugs in the conjugates. Complete killing of all  
 CC target cells may not be essential since partial denudation of endothelium  
 CC may result in an occlusive thrombus, and endothelial cells are unlikely  
 CC to become resistant to anticancer agents nor to lose the targeting  
 CC receptor. AAM93622-W93809 and AAM93843-44 are examples of tumour homing  
 CC peptides used in the invention.

XX Homing pro-apoptotic conjugate comprising a tumor homing molecule that  
PT selectively homes to a mammalian cell type or tissue linked to an  
PT antimicrobial peptide, useful for the treatment of prostate cancer -  
XX  
XX Claim 12; Page 105; 118pp; English.  
PS  
XX The present invention relates to homing pro-apoptotic conjugates,  
CC comprising of a tumor homing molecule that selectively homes to a  
CC mammalian cell type or tissue, linked to an antimicrobial peptide. The  
CC homing pro-apoptotic conjugates are selectively internalised by the  
CC mammalian cell type or tissue and exhibits high toxicity, especially to  
CC angiogenic vasculature. The antimicrobial peptide has low mammalian cell  
CC toxicity when not linked to the tumor homing molecule. The conjugates are  
CC useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and  
CC prostate cancer or melanoma. The present sequence is a homing peptide  
CC isolated in the present invention, which can be conjugated to an  
CC antimicrobial peptide to make the homing pro-apoptotic conjugates of the  
CC present invention.

XX Novel composition of matter comprising an Fc domain and  
PT pharmacologically active peptides, useful for treating cancer and  
PT autoimmune diseases -  
XX  
XX Claim 39; Page 354; 608pp; English.  
PS  
XX  
XX The present invention describes composition of matter (I) comprising an  
CC Fc domain, pharmacologically active peptides, and linkers. Where (I) is:  
CC (X1)a-F1-(X2)b, where: F1 = an Fc domain; X1 and X2 = are each  
CC independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2,  
CC -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4  
CC where P1, P2, P3, and P4 = are each independently sequences of  
CC pharmacologically active peptides; L1, L2, L3, and L4 = are each  
CC independently linkers; and a, b, c, d, e, and f = are each independently  
CC 0 or 1, provided that at least 1 of a and b is 1. The composition can  
CC have cytostatic, antiasthmatic, thrombolytic and immunosuppressive  
CC activities. DNAs, vectors and host cells from the present invention can  
CC be used for producing pharmaceutical compositions. The compositions are  
CC useful for treating cancer, asthma, thrombosis, or autoimmune diseases.  
CC The use of an Fc domain (rather than a Fab domain) can provide a longer  
CC half-life or incorporate functions such as Fc receptor binding, protein  
CC A binding, complement fixation, and possibly placental transfer. AAA6943  
CC to AAA6526 and AAB16955 to AAB18003 represent nucleotide and amino acid  
CC sequences used in the exemplification of the present invention.

PT adenovirus vectors having modified hexon HVRS and HI loops and modified  
PT fiber proteins useful for targeted gene therapy to treat cancer or  
PT restenosis

Example 5: Page 53; 128pp; English.

CC This sequence represents a alpha integrin targeting peptide.  
CC The invention relates to an adenovirus from which at  
CC least a part of the hexon HVRS or HI loop is replaced with a binding  
CC peptide, or targeting sequence, flanked by connecting amino acid spacers,  
CC to functionally display its binding specificity at the capsid surface.  
CC The invention also relates to a recombinant adenovirus vector where a  
CC binding peptide, or targeting sequence, is connected to the C-terminus of  
CC the fiber by a connecting spacer, or linker, so as to functionally  
CC display its binding specificity at the capsid surface. The adenovirus or  
CC recombinant adenovirus vector can be used to preferentially express a  
CC gene in a target cell, especially a cell that expresses a UPAK. The  
CC targeted adenovirus vector preferably comprises a heterologous gene  
CC encoding a gene for treatment of a tumour or restenosis. The targeted  
CC adenovirus vector is useful for gene therapy treatment of a disease, and  
CC for manufacturing a medicine used in gene therapy treatment of a disease.  
CC The viruses can also be used to inhibit smooth muscle cell proliferation,  
CC to treat peripheral artery diseases, coronary artery diseases, obesity,  
CC neurodegenerative diseases, infections, autoimmune diseases, asthma, HIV,  
CC thrombosis, and diabetes. The viruses are particularly targeted against a  
CC uridine-type plasmidogen activator receptor (UPAR). The adenoviruses  
CC are tropism-modified without adversely impacting productivity of the  
CC vectors.

PT Inhibitors of the KDEL receptor which comprises an oligomerization  
XX domain useful for promoting secretion of proteins which are normally

PT retained within the cell -  
XX  
XX Disclosure; Page 17; 87pp; English.

CC The patent discloses the use of KDEL receptor inhibitor to promote  
CC secretion of proteins that are normally retained within the cell such as  
CC heat shock proteins by inhibiting KDEL receptor-mediated return of  
CC protein complexes to endoplasmic reticulum. This makes the secreted heat  
CC shock proteins more accessible to the immune system and improves immune  
CC response to a target antigen. The inhibitor protein comprises several  
CC subunits where each subunit comprises an oligomerisation domain and has  
CC at its carboxy terminus a region which binds to a KDEL receptor. The  
CC target antigen may be associated with diseases including neoplasia such  
CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and  
CC astrocytoma, with defective tumour suppressor genes, oncogenes,  
CC infectious diseases, allergy or autoimmune diseases. The present  
CC sequence is a targeting peptide termed RGD-4C. This may be incorporated  
CC into the amino terminal region of a KDEL receptor inhibitor protein  
CC downstream from a cleavably removed sequence to improve its activity or  
CC alter its immunogenicity.

XX Novel isolated nucleic acid, useful for gene therapy

XX Example 10; Page 84; 190pp; English.

CC The specification describes mutant retrovirus envelope proteins. The  
CC envelope protein coding sequence can be mutated to encode a mutant  
CC envelope protein with a substitution of one or more amino acids in at  
CC least one motif of the retrovirus protein. The mutant protein fragment  
CC allows for decreased shedding of the surface protein by suppressing

CC precursor cleavage and increase envelope stability and fusion of  
CC retroviruses with cell membranes, while maintaining mutant envelope  
CC protein incorporation into a virion, and viral titers of about two orders  
CC of magnitude within that observed for wild-type retrovirus when the  
CC protein or fragment is expressed on the surface of a retroviral particle.  
CC The proteins have an increased ability to penetrate targets, typically  
CC cells and a correspondingly increased ability to deliver nucleic acids or  
CC drugs. The mutated nucleic acid is useful for gene and drug therapy  
CC especially as drug delivery vehicles. The retrovirus particles can be  
CC utilized to transduce eukaryotic cells. The transduced cells are useful  
CC in the treatment of cancer in a human. Other diseases contemplated for  
CC treatment include adenosine deaminase deficiency (ADA), thalassemia,  
CC hemophilia, diabetes, alpha-anti trypsin deficiency, brain and neural  
CC disorders, phenylketonuria, growth disorders, heart diseases and immune  
CC diseases. The present sequence was used in the course of the invention,  
CC to quantitate targeted retroviral vector gene delivery in vivo.

PT polypeptides for treating viral infections (e.g. bovine viral diarrhoea  
PT or human immunodeficiency virus), or cancers (e.g. leukemia or  
PT lymphoma)  
XX  
XX  
PS Disclosure: Column 11; 41pp; English.  
XX  
XX The invention relates to a cytokine designated as tumour necrosis  
CC factor (TNF) related apoptosis inducing ligand (TRAIL), which induces  
CC apoptosis of certain target cells, including cancer cells and virally

CC infected cells. The TRAIL polypeptides are useful in killing cancer  
CC cells, in treating viral infections (e.g. bovine viral diarrhoea or  
CC human immunodeficiency virus (HIV)) and cancers (e.g. Leukaemia,  
CC lymphoma and melanoma), as a research reagent useful in studying  
CC apoptosis including the regulation of programmed cell death. TRAIL  
CC DNA sequences may be employed in developing a gene therapy approach  
CC to treating disorders mediated by defective or insufficient amounts  
CC of TRAIL, in the production of TRAIL polypeptides and as probes or  
CC primers in polymerase chain reactions (PCR). The present sequence is  
CC a RGD-containing peptide that binds an integrin associated with  
CC tumour. This sequence is used to construct a fusion protein  
CC comprising TRAIL protein.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

RESULT 11  
US-09-455-061-3  
Sequence 3, Application US/09455061  
Patent No. 6329190  
GENERAL INFORMATION:  
APPLICANT: Wickham, Thomas J.  
APPLICANT: Kovesdi, Imre  
APPLICANT: Roselink, Petrus W.  
TITLE OF INVENTION: TARGETING ADENOVIRUS WITH USE OF  
TITLE OF INVENTION: CONSTRAINED PEPTIDE MOTIFS  
NUMBER OF SEQUENCES: 80  
CORRESPONDENCE ADDRESS:  
ADDRESSEE: Leydig, Volt & Mayer, Ltd.  
STREET: Two Prudential Plaza - 49th Floor  
CITY: Chicago  
STATE: Illinois  
COUNTRY: USA  
ZIP: 60601  
COMPUTER READABLE FORM:  
MEDIUM TYPE: Floppy disk  
COMPUTER: IBM PC compatible  
OPERATING SYSTEM: PC-DOS/MS-DOS  
SOFTWARE: Patentin Release #1.0, Version #1.30  
CURRENT APPLICATION DATA:  
APPLICATION NUMBER: US/09/455,061  
FILING DATE: 06-DEC-1999  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: US 9-130225  
FILING DATE: 06-AUG-1998  
PRIOR APPLICATION DATA:  
APPLICATION NUMBER: US 8-701124  
FILING DATE: 21-AUG-1996  
ATTORNEY/AGENT INFORMATION:  
NAME: Hefner, M. Daniel  
REGISTRATION NUMBER: 41,826  
REFERENCE/DOCKET NUMBER: 203128  
INFORMATION FOR SEQ ID NO: 3:

SEQUENCE CHARACTERISTICS:  
LENGTH: 9 amino acids  
TYPE: amino acid  
STRANDEDNESS: single  
TOPOLOGY: linear  
MOLECULE TYPE: peptide  
US-09-455-061-3

Query Match 100.0%; Score 65; DB 4; Length 9;

RESULT 12  
US-09-174-943-8  
Sequence 8, Application US/09174943  
Patent No. 6420110  
GENERAL INFORMATION:  
APPLICANT: GYURIS, JENO  
APPLICANT: MORRIS, AARON J.  
TITLE OF INVENTION: METHODS AND REAGENTS FOR ISOLATING BIOLOGICALLY ACTIVE  
TITLE OF INVENTION: PEPTIDES  
FILE REFERENCE: MIV-106.01  
CURRENT APPLICATION NUMBER: US/09/174,943  
CURRENT FILING DATE: 1998-10-19  
NUMBER OF SEQ ID NOS: 8  
SOFTWARE: Patentin Ver. 2.0  
SEQ ID NO 8  
LENGTH: 9  
TYPE: PRT  
ORGANISM: Artificial Sequence  
FEATURE:  
OTHER INFORMATION: Description of Artificial Sequence: RGD motif  
US-09-174-943-8
